Challenges and Solutions to Improving Tdap Vaccination of Pregnant Women: A New Campaign to Promote Tdap Vaccine during Pregnancy

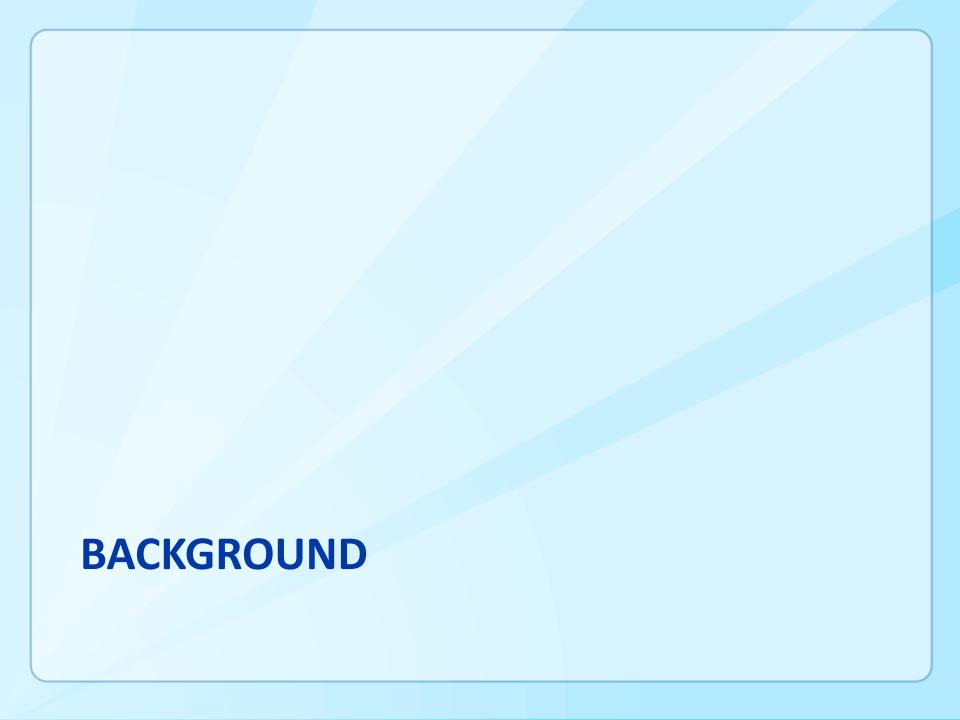

Leslie Rodriguez, PhD
Health Communications Specialist
National Center for Immunization and Respiratory Diseases

National Adult Immunization Coordinators' Partnership July 7, 2015

Presentation Objectives

- Discuss findings and guiding principles from formative research with pregnant women and obstetriciangynecologists (ob-gyns)
- Discuss campaign materials for pregnant women and healthcare professionals
- Discuss ways to disseminate these materials and messages

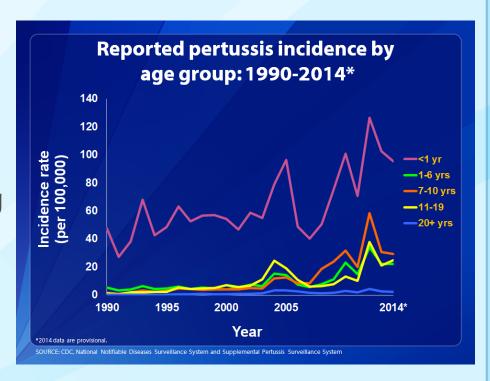

Pertussis (Whooping Cough) and Infants

- Pertussis is a contagious respiratory disease characterized by a severe cough that can last for weeks or months
- Young infants are at greatest risk for getting pertussis and suffering from life-threatening complications
- DTaP vaccine is recommended at 2, 4, 6, 15-18 months, and 4-6 years to prevent pertussis and reduce the severity of symptoms

^{*} Source: cdc.gov/pertussis

Pertussis Trends

- Despite high DTaP coverage, more than 28,000 U.S. cases reported in 2014,* including 7 deaths among infants less than 3 mo old
 - Multiple factors are contributing to the pertussis resurgence

- Current efforts focused on
 - protecting infants by vaccinating pregnant women; and
 - routine childhood and adolescent pertussis vaccine recommendations

*2014 data are provisional and subject to change.

Source: CDC, National Notifiable Diseases Surveillance System and Supplemental Pertussis Surveillance System

Tdap Vaccine During Pregnancy

- In 2012, Tdap administration was recommended during pregnancy to help protect babies until they start the DTaP series
 - Ideal administration between 27 and 36 weeks gestation for best maternal antibody response and transfer of immunity to baby
 - Recommended during each pregnancy regardless of Tdap vaccination history or pregnancy spacing
- Uptake of Tdap during pregnancy, while increasing since the 2012 recommendation, is still low

* Source: cdc.gov/pertussis

Formative Research With Pregnant Women

- Survey of pregnant women
 - Online survey of U.S. women 18–45 years of age
 - 487 respondents were eligible and completed the survey
 - Data were collected in June/July of 2014
- Focus groups with pregnant women
 - 28 focus groups of pregnant women
 - High pertussis incidence (San Diego) and low pertussis incidence (Atlanta) locations
 - Segmented by parity and language (English and Spanish)
 - Mix of trimester, race/ethnicity, and socioeconomic background
 - Conducted in two rounds (June and September/October 2014)

Guiding Principles for Pregnant Women

 Levels of awareness of pertussis and perceived susceptibility to the disease are low among pregnant women.

Pregnant women are primarily concerned with the health and safety of their baby when making decisions about vaccines during pregnancy.

 Pregnant women view their ob-gyn or midwife as the ultimate authority on pregnancy-related topics.

Health and Safety of Baby

- Concern over the baby's safety (50%) was the most common reason survey respondents were unsure if they would get Tdap during their current pregnancy
- Protecting the baby was the strongest motivator for vaccination among focus group participants

"The most valuable thing is that not only will you be immunized but your baby will be born already immunized too, until he receives his own vaccine."

Health and Safety of Baby

 Messages that mentioned disease risk for baby were generally more likely to encourage undecided survey participants to accept Tdap vaccination

"Whooping cough is a serious disease that can cause babies to stop breathing."

"Most whooping cough deaths are among babies younger than 3 months of age."

"People can spread whooping cough to babies without even knowing they are sick because the illness can be mild for adults."

Healthcare Professional's Influence

- Survey respondents most often reported seeking Tdap information online (75%), from a healthcare professional (64%), or from friends (45%)
- A healthcare professional's recommendation was the most common reason for accepting Tdap (69%) among survey participants
- □ Focus groups preferred "Talk to your doctor about the whooping cough vaccine" over "get the vaccine" as a call to action for Tdap vaccination

Formative Research with Ob-Gyns

- Survey of ob-gyns
 - Online survey of 32,056 members of the American College of Obstetricians and Gynecologists (ACOG)
 - Respondents all offer prenatal care
 - Data were collected in February and March of 2014
 - 2,365 respondents completed the survey
- In-depth interviews with ob-gyns
 - 60-minute telephone interviews with ob-gyns nationally
 - Respondents all offer prenatal care
 - Interviews were conducted in May and June of 2014
 - 24 interviews in May
 - 16 interviews in June

Guiding Principles for Ob-Gyns

- Knowledge of the Tdap recommendation during pregnancy is high, but perception of individual risk for their patients (and their babies) is often low.
- Stocking Tdap is a barrier for some ob-gyns, often due to issues with reimbursement.
- The most common channels for sharing vaccine information with patients are face-to-face during the office visit and in handouts at the first prenatal appointment.

Knowledge and Awareness

 Nearly all survey respondents reported recommending Tdap to pregnant patients, with 77% administering the vaccine in their office

Approach	Frequency (n)	%
I recommend Tdap vaccine to my pregnant patients and vaccinate them in my office.	1,807	77.1 %
I recommend Tdap vaccine to my pregnant patients but refer them elsewhere to receive the vaccine.	486	20.7%
I do not routinely discuss Tdap vaccine with my pregnant patients.	35	1.5%
I discuss Tdap vaccine with my pregnant patients but do not offer a recommendation for or against vaccination.	13	0.6%
I recommend against Tdap vaccine for my pregnant patients.	2	0.1%

Preliminary

Barriers to Stocking Tdap

- Concerns over reimbursement were a barrier to stocking vaccine for some interviewees
- Most physicians interviewed who recommended but didn't stock Tdap did not follow-up with patients later
- Despite barriers, most interviewees felt that the obstetric provider was responsible for vaccinating pregnant women

"I've got those patients, you know, on a regular basis. They're coming back every month, every couple of weeks whenever it is...so, I think since the obstetrician has certainly more opportunity and access to the patient --that's probably the best place to do it."

Information Channels

- Most respondents (88%) use brochures or handouts to communicate with pregnant patients
- Posters, patient websites, and training materials for staff were also listed as useful tools
- Respondents turned to ACOG and CDC most often for vaccine information for themselves and their patients

Born with Protection Against Whooping Cough

A New Maternal Tdap Campaign

- Developed in collaboration with co-branding partners:
 - American Academy of Family Physicians
 - American Academy of Pediatrics
 - American College of Nurse-Midwives
 - American College of Obstetricians and Gynecologists
- Targets pregnant women and prenatal healthcare professionals
- English and Spanish language materials for women
- Based on mixed method formative research and input from subject matter experts and partners

Campaign Objectives

- Pregnant women
 - Increase awareness of the maternal Tdap recommendation
 - Encourage women to speak with their prenatal healthcare professional about Tdap vaccination
- Ob-gyns and other prenatal healthcare professionals
 - Strengthen recommendations for Tdap during pregnancy among pregnant women
 - Strengthen referrals for Tdap among pregnant women

For Pregnant Women

English Language Campaign

"The whooping cough vaccine I got during my 3rd trimester will help protect my baby starting at her first breath."

Whooping cough can make your baby very sick with coughing fits and gasping for air. It can even be deadly, and there are outbreaks happening across the United States. When you get the whooping cough vaccine (also called Tdap) during the third trimester of your pregnancy, you'll pass antibodies to your baby that will help protect her from this disease from the time she's born. These antibodies will last for the first few months of her life, when she is most vulnerable to serious disease and complications.

Talk to your doctor or midwife about the whooping cough vaccine.

Born with protection against whooping cough.

Factsheets for Healthcare Professionals (1)

Provide the best prenatal care to prevent pertussis

Strategies for healthcare professionals

Pertussis is on the rise and outbreaks are happening across the United States. In recent years, up to 1,450 infents have been hospitalized and about 10 to 20 have died each year in the United States due to pertussis. Most of these deaths are among infents who are too young to be protected by the childhood pertussis veccine series that sterts when infents are 2 months old.

These first few months of life ere when infants are at greetest risk of contracting pertussis and having severe, potentially life-threatening complications from the infaction. To help protect bebies during this time when they are most vulnerable, women should get the tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis (Tdap) vaccine during each pregnancy. A strong recommendation from you may ultimately be what most influences whether or not your patients' newborns are protected against perfussis.

Strongly recommend Tdap to your patients during the 3rd trimester of each pregnancy.

5 Facts about Tdap and Pregnancy

Tdap during pregnancy provides the best protection for mother and infant.

- Recommend and administer or refer your patients to receive Tdap during every pregnancy.
- Optimal timing is between 27 and 36 weeks gestation to maximize the maternal antibody response and passive antibody transfer to the infant.
- Fewer babies will be hospitalized for and die from pertussis when Tdap is given during pregnancy rather than during the postpartum period.

2. Postpartum Tdap administration is NOT optimal.

- Postpartum Tdap administration does not provide immunity to the infant, who is most vulnerable to the disease's serious complications
- Infants remain at risk of contracting pertussis from others, including siblings, grandparents, and other caregivers.
- It takes about 2 weeks after Tdap receipt for the mother to have protection against pertussis, which means the mother is still at risk for catching and spreading the disease to her newborn during this

Cocooning alone may not be effective and is hard to implement.

- The term "cocooning" means vaccinating anyone who comes in close contact with an infant.
- It is difficult and can be costly to make sure that everyone who is around an infant is vaccinated.

Tdap should NOT be offered as part of routine preconception care.

- Protection from pertussis vaccines does not last as long as vaccine experts would like, so Tdap is recommended during pregnancy in order to provide optimal protection to the infant.
- If Tdap is administered at a preconception visit, it should be administered again during pregnancy between 27 and 36 weeks gestation.

Tdap can be safely administered earlier in pregnancy if needed

- Pregnant women should receive Tdap anytime during pregnancy if it is indicated for wound care or during a community pertussis
- If Tdap is administered earlier in pregnancy, it should not be repeated between 27 and 36 weeks gestation; only one dose is recommended during each pregnancy.

Resources about Tdap and Pregnancy for Healthcare Professionals

Get Reimbursed for Tdap Vaccination

Coding and billing are known barriers to administering vaccines during pregnancy. Correct coding enables an office to report these activities to third-party payers and receive appropriate reimbursement for these services.

 ACOG's Tdap Toolkit provides coding and billing information for Tdap: www.acog.org/TdapToolKit

Get Vaccine Referral Tips

Not all clinicians are able to stock and administer Tdap or influenza vaccines in their office.

Factsheets for Healthcare Professionals (2)

Making a strong vaccine referral to pregnant women

Strategies for healthcare professionals

Stocking and administering vaccines in your office may not be feasible for all prenatal healthcare professionals, often due to issues with reimbursement. By making a strong vaccine referral, you can help ensure that your pregnant patients receive the recommended influenza (flu) and textual toxoid, reduced diphtheria toxoid, and acellular pertussis (Tdap) vaccines even if you are unable to administer them in your office. The strategies outlined are based on research with healthcare professionals and pregnant women. The goal is to strengthen vaccine referrals to increase the likelihood of patient follow through.

Making the Referral

Begin each referral with a vaccine recommendation that includes information on why the vaccine is beneficial and safe for mother and baby. Tailoring your message with scientific data or personal anecdates may help convey the vaccine's importance to individual patients.

Provide information on where patients can get the vaccine(s) you recommend. For help locating vaccines in your area, the HealthMap Vaccine Finder is available at: http://waccine.healthmap.org.

Always write a patient-specific prescription. This will help your patients obtain the vaccine at another location where a prescription may be required.

Anticipate questions on why patients cannot get vaccinated in your office. For example, if you stock flu vaccine, but not Tdap, be prepared to explain why you offer one vaccine but not the other.

Re-emphasize vaccine importance. Remember to emphasize the fact that just because you do not stock a specific vaccine in your office does not mean it is not important, is less important than other vaccines you do stock, or that you have concerns about its safety.

Have a plan in place to answer questions from other immunization providers who are concerned with vaccinating your pregnant patients. Questions should be answered promptly, as it is likely your patient is with them at the time they contact you.

Vaccines Routinely Recommended for Pregnant Women

It is safe for the flu vaccine and Tdap vaccine to be given to pregnant patients at the same time.

Flu Vaccine

- Is recommended for pregnant women and safe to administer during any trimester.
- Is the best way to protect pregnant women and their babies from the flu, and prevent possible flu-associated pregnancy complications.
- Is safe and can help protect the baby from flu for up to 6 months after birth. This is important because babies younger than 6 months of age are too young to get a flu veccine.

Idap Vaccine

- Is recommended during every pregnancy, ideally between 27 and 36 weeks gestation.
- When given during pregnancy, boosts antibodies in the mother, which are transplacentally transferred to her unborn baby. Third trimester administration optimizes neonatal antibody levels.
- Helps protect infants, who are at greatest risk for developing pertussis and its life-threatening complications, until they are old enough to start the childhood pertussis vaccine series.

Timing the Referral

Vaccines recommended for pregnant women should be discussed with patients early in pregnancy, with the formal referral made during the recommended timeframe for administration.

- Flu vaccine: Your referral should be made as early as possible once pregnancy is confirmed. Pregnant women can be vaccinated during any trimester, keeping in mind that flu vaccine is typically available August to May, covering the duration of flu season.
- Tdap vaccine: Your recommendation and referral should be made as close to 27 weeks as possible so there is ample time during the recommendation window (between 27 and 36 weeks) to follow up and re-emphasize the importance of getting the Tdap vaccine, if the patient has not received it yet.

You may find linking the timing of the Tdap referral with another third trimester practice beneficial. Many clinicians have been successful pairing their Tdap referral with the glucose test conducted at 28 weeks.

Follow-Up after Referral

After every referral, you should follow-up with each patient during subsequent appointments to ensure the patient received the vaccine(s). It may be helpful to include a reminder in your electronic medical records (EMR).

As part of the follow-up, document vaccine receipt in each patient's medical record. If your patient did not follow through with the referral, repeat the recommendation and referral and try to identify and address any questions or concerns that she may have encountered. Your commitment to making a strong referral and following up with patients is vital to increasing vaccination rates among pregnant women and protecting them and their bables from serious diseases.

Puedes empezar a proteger a tu bebé de **la tosferina** desde antes del nacimiento

La tosferina (también conocida como pertussis o whooping cough) se una enfermedad grave que pueda ocasionar que los bebés dejen de respirar. Desafortunadamente, los bebés dejen de respirar. Desafortunadamente, los bebés deben haber cumpido 2 meses de edad antes de poder se vacunados contra la tosferina. Las buenas noticias son que puedas evitar este período de desprotección de tu bebé al vacunarte contra la tosferina en tu tercer trimestre, preferiblemente entre las 27 y 36 semanas de embarazo. A la vacuna se le conoce como la DPT (O Tdap, en ingilés) ya que protege contra el tráenos, la differia y la tosferina. Al recibir la vacuna, le transmitirás los anticuerpos o defensas a tu bebé, de menera que el bebé necerá protegicio contra la tosferina.

American Academy of Pediatrics

Cuando tú te vacunas contra la tosferina durante tu tercer trimestre, tu bebé nacerá protegido contra esta enfermedad.

¿Por qué tengo que vacunarme contra la tosferina

Se te recomienda vacunarte contra la tosferina durante

You can start protecting your baby from whooping cough before birth

Information for pregnant women

Whooping cough (sometimes called pertussis) is a serious disease that can cause babies to stop breathing. Unfortunately, babies must be 2 months old before they can start getting their whooping cough vaccine. The good news is you can avoid this gap in protection by getting the whooping cough vaccine (also called the Tdap shot because it protects against tetanus, diphtheria, and pertussis) in your third trimester, preferably between your 27th and 36th week of pregnancy. By getting vaccinated, you will pass antibodies to your baby so she is born with protection against whooping cough.

Fact Sheet for Pregnant Women

- Focus on benefit to baby
- Safety (top concern) is addressed early
- Information to raise awareness that whooping cough is a concern today
- Cobranding

When you get the whooping cough vaccine during your 3rd trimester, your baby will be born with protection against whooping cough.

Why do I need to get a whooping cough vaccine while I am pregnant?

The whooping cough vaccine is recommended during your third trimester so that your body can create antibodies and pass them to your baby before birth. These antibodies will help protect your newborn right after birth and until your baby gets his own first whooping cough vaccine at 2 months of age. During the first few months of life, your baby is most vulnerable to serious complications from this disease.

Is this vaccine safe for me and my baby?

Yes. The whooping cough vaccine is very safe for you and your baby. The most common side effects are mild. like redness, swelling or pain where the shot is given in the arm. This should go away within a few days. You cannot get whooping cough from the vaccine. The vaccine does not contain any live bacteria.

Doctors and midwives who specialize in caring for pregnant women agree that the whooping cough vaccine is afe and important to get during the third trimester of each pregnancy. Getting the vaccine during pregnancy does not put you at increased risk for pregnancy complications like low birth weight or preterm delivery.

If I recently got this vaccine, why do I need to get it again?

The amount of antibodies in your body is highest about 2 weeks after getting the vaccine, but then starts to decrease over time. That is why the vaccine is recommended during every pregnancy – so that each of your babies gets the greatest number of protective antibodies from you and the best protection possible against this disease.

Are babies even getting whooping cough anymore in the United States?

Yes. In fact, babies are at greatest risk for getting whooping cough. We used to think of this as a disease of the past, but it's making a comeback. Recently, we saw the most cases we had seen in 60 years. Since 2010, we see between 10,000 and 50,000 cases of whooping cough each year in the United States. Cases, which include people of all ages, are reported in every tate.

www.cdc.gov/whoopingcough

Fact Sheet for Pregnant Women (2)

Mom, only you can provide your newborn baby with the best protection possible against whooping cough.

You may have heard that your baby's father, grandparents, and others who will be in contact will need to get their whooping cough vaccine as well. This strategy of surrounding babies wagainst whooping cough is called "cocooning." However, cocooning might not be enough to whooping cough illness and death. This is because cocooning does not provide any direct produced in their whooping cough vaccine. Since cocooning does not completely protect babies from whooping cough vaccine. Since cocooning does not completely protect babies from whooping the cough, it is even more important that you get the vaccine while you are pregnant.

La historia real de tosferina de una familia

La hija de Katie y Craig, Callie, cuando tenia solo un poco mas de un mes de edad contrajo una tos suave y seca. En los días siguientes, la condición de Callie empeoró. Siguió tosiendo, se puso pálida, no se movía mucho y de repente perdió su saludable apetito. Cuando Callie dejó de respirar, la trasladaron rápidamente al hospital en una ambulancia. Médicos pudieron resucitarla pero la próxima vez que dejo de respirar, no pudieron salvarla. Unos pocos días después, la familia supo que Callie había fallecido a causa de la tosferina. "No podíamos creerlo. Éramos muy cuidadosos de no exponerla a muchas personas", dice Katie. Con tan solo 5 semanas de edad, Callie era muy pequeña para recibir la vacuna contra la tosferina. A partir de 2012, se recomienda a las mujeres embarazadas recibirse la vacuna contra la tosferina, llamada Tdap, en el tercer trimestre de su

appointment.

Protect my baby

Next Steps

- Continue to promote awareness of campaign materials and messages
- Analyze additional research
 - Survey with nurses, nurse practitioners, and nurse-midwives
- Publish research to practice efforts
- Evaluation of campaign reach
 - Web metrics
 - Re-fielding of ob-gyn and pregnant women's surveys

What We Are Asking Partners To Do

- □ GIVE STRONG RECOMMENDATIONS for whooping cough vaccine (Tdap) in the 3rd trimester of each pregnancy
- ASK HEALTHCARE PROFESSIONALS to include Born with Protection campaign materials in prenatal information packets

www.cdc.gov/pertussis/materials/index.html

- ENCOURAGE pregnant women to ask their doctor or midwife about whooping cough vaccine
- PROMOTE CDC's Tdap during pregnancy website and materials through your social media channels

ww.cdc.gov/pertussis/pregnant

More Ways to Get Involved!

- ALERT prenatal healthcare professionals that whooping cough outbreaks are happening across the U.S.
- RAISE AWARENESS among prenatal healthcare professionals that:
 - 3rd trimester vaccination every pregnancy offers the best protection for baby
 - Postpartum Tdap administration is NOT optimal
 - Cocooning alone may not be effective and is hard to implement
- DIRECT pregnant women to CDC information about Tdap during pregnancy

www.cdc.gov/pertussis/pregnant

□ COLLABORATE with us to expand the campaign's reach
